Listing of Claims

- 1. (Original) A method of monitoring the condition and/or operation of a furnace comprising the step of measuring sub-surface chromium-depletion from a steel member.
- 2. (Original) A method as claimed in claim 1, wherein the steel member is a pipe within a pyrolysis furnace through which hydrocarbons flow.
- 3. (Currently amended) A method as claimed in claim 1 [[or 2]], further comprising the step of using the measurement of chromium depletion to estimate the state of a surface oxide layer.
- 4. (Currently amended) A method as claimed in <u>claim 1</u> any preceding claim, further comprising the step of using the measurement of chromium depletion to determining whether burners in the furnace are operating satisfactorily.
- 5. (Currently amended) A method as claimed in <u>claim 1</u> any preceding claim, wherein a magnetic source of known strength is used to create a magnetic field in the surface region of the steel member and an estimate of the thickness of the chromium-depleted zone is determined from the resultant magnetic flux density at the surface of the member.
- 6. (Original) A method of determining the thickness of a chromium-depleted zone of a surface region of a steel member comprising the steps of using a magnetic source of known strength to create a magnetic field in the surface region and then determining an estimate of

ATTORNEY DOCKET NO. 04150.0016U1 International Application No. PCT/EP2003/007997

the thickness of the chromium depleted zone from the resultant magnetic flux density at the surface of the member.

- 7. (Currently amended) A method as claimed in claim [[5 or]] 6, wherein the flux density is measured at a position where the magnetic field lines are generally normal to the surface.
- 8. (Currently amended) A method as claimed in claim [[5,]] 6 [[or 7]], wherein the magnetic field is created in the surface region by a magnet having its axis at between 30 degrees and 60 degrees to the surface of the steel member.
- 9. (Original) A method as claimed in claim 8, wherein the axis of the magnets is at substantially 45 degrees to the surface of the member.
- 10. (Currently amended) A method as claimed in <u>claim 6</u> any of claims 5 to 9, wherein the magnetic field is created by a permanent magnet.
- 11. (Currently amended) A method as claimed in <u>claim 6</u> any of claims 5 to 10, wherein the magnetic flux density is determined by a Hall-effect probe located proximate the surface of the steel member.
- 12. (Original) A method as claimed in claim 11, wherein a hard non-magnetic pad is provided between the Hall- effect probe and the surface.
- 13. (Currently amended) A method as claimed in claim 11 [[or 12]], wherein the field detection axis of the Hall-effect probe is aligned at substantially 45 degrees to the north-south axis of the source of the magnetic field.

ATTORNEY DOCKET NO. 04150.0016U1 International Application No. PCT/EP2003/007997

- 14. (Currently amended) A method as claimed in claim 11, [[12 or 13]] wherein an output signal from the Hall-effect probe is processed in order to provide a direct indication of the thickness of the chromium depleted zone and/or the thickness of an associated oxide layer.
- 15. (Currently amended) A method as claimed in <u>claim 6</u> any preceding claim, further comprising the step of determining an estimate of the surface oxide layer thickness.
- 16. (Original) Apparatus for determining the thickness of a chromium depleted zone of a surface region of a steel member, the apparatus comprising a magnetic field source and a means for measuring magnetic flux density, wherein the apparatus is arranged such that when it is placed proximate to a steel member the measuring means, determines the magnetic flux density in the surface region of the steel resulting from the magnetic field source.
- 17. (Original) Apparatus as claimed in claim 16, further comprising means to process the output from the measuring means and to display the thickness of the chromium depleted zone and/or the thickness of an associated oxide layer.
- 18. (Currently amended) Apparatus as claimed in claim 16 [[or 17]] arranged to operate in accordance with the method of monitoring the condition and/or operation of a furnace comprising the step of measuring sub-surface chromium-depletion from a steel member any of claims 1 to 15.
